GLOBAL ECOLOGY CORPORATION ANNOUNCES THE DEVELOPMENT OF ITS FIRST FERTILIZER PRODUCTION FACILITIES IN THE UNITED STATES

June 1 2011, Montclair, New Jersey. Global Ecology Corporation (GEC), (GLEC:OTCQB) is pleased to announce the signing of Letters of Intent with three towns in southern Alabama; Town of Castleberry, Town of Fort Deposit and the City of White Hall. The purpose of these agreements is to develop waste remediation facilities in each town for the production of natural fertilizer and soil additives. Additionally, the deployment of GEC’s organic waste remediation technology will greatly reduce the need for acquiring additional landfill sites.

Funding for the project will be provided by each town through available grant programs in conjunction with private sector money as well. Each town will receive a percentage of the location’s revenue and each site will create new jobs for the local residents. The final product will be sold to local farmers, turf produces, golf courses and a number of other agricultural applications.

Mayor Lenwood Herron, from neighboring New Brockton said, “The use of waste from local sources for the creation of this highly nutritious fertilizer will change the method of soil enhancement in the area while improving the local economy”.

“We are proud to be associated with Castleberry, Fort Deposit and Whitehall. These communities have given us the opportunity to bring our process to the US and have helped them create new jobs and substantial revenue. We look forward to expanding this form of public/private partnership in other areas of the country over time. We’d also like to thank Mayor Herron for his substantial effort that resulted in the formation of our participating townships.” stated Peter Ubaldi, CEO of Global Ecology.

About Global Ecology Corporation

Through its extensive network, Global Ecology Corporation (GEC) has obtained licensing rights to several EPA-approved technologies in the water treatment and soil remediation fields. These proprietary technologies help reduce algae, bottom sludge and harmful bacteria and are able to provide "green" and if needed, transportable methods to recover the usability of water, soil and land. For more information, please visit www.geco.us
